Lecture 10: C/Assembler Logical and Shift – II & Multiplication

http://webct.edtec.unsw.edu.au/

March 2005

Saeid Nooshabadi

saeid@unsw.edu.au

Overview

- Shift Operations
  - Field Insertion
- Multiplication Operations
  - Multiplication
  - Long Multiplication
  - Multiplication and accumulation
  - Signed and unsigned multiplications

Review: ARM Instructions So far

`add`

`sub`

`mov`

`and`

`bic`

`orr`

`eor`

Data Processing Instructions with shift and rotate

`lsl, lsr, asr, ror`

Review: Masking via Logical AND

- AND:Note that anding a bit with 0 produces a 0 at the output while anding a bit with 1 produces the original bit.
- This can be used to create a mask.
  - Example:

1011 0110 1010 0100 0011 1101 1001 1010

Mask: 0000 0000 0000 0000 0000 0000 1111 1111

  - The result of anding these two is:

0000 0000 0000 0000 0000 0000 1001 1010

Review: Masking via Logical BIC

° BIC (AND NOT):Note that `bic`ing a bit with 1 produces a 0 at the output while `bic`ing a bit with 0 produces the original bit.

° This can be used to create a mask.

- Example:

1011 0110 1010 0100 0011 1101 1001 1010

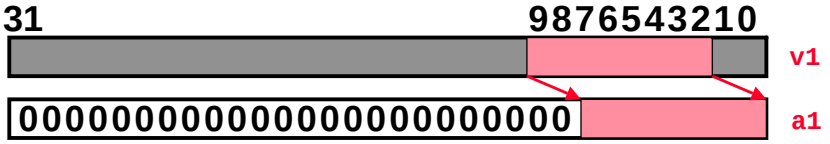
Mask: 0000 0000 0000 0000 0000 0000 1111 1111

- The result of `bic`ing these two is:

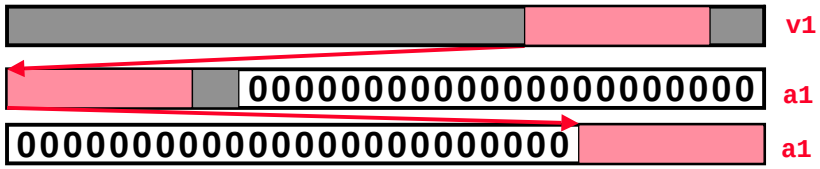
1011 0110 1010 0100 0011 1101 0000 0000

Extracting a field of bits (#1/2)

° Extract bit field from bit 9 (left bit no.) to bit 2 (size=8 bits) of register v1, place in rightmost part of register a1

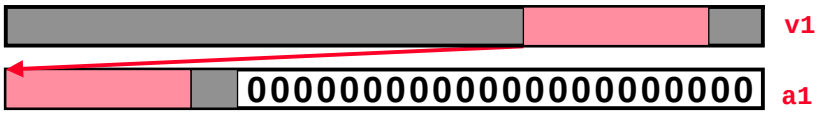


° Shift field as far left as possible (9 →31) and then as far right as possible (31→7)

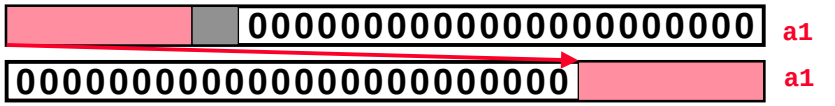


Extracting a field of bits (#2/2)

```
mov a1, v1, lsl #22 ;8 bits to left end (31-9)
```

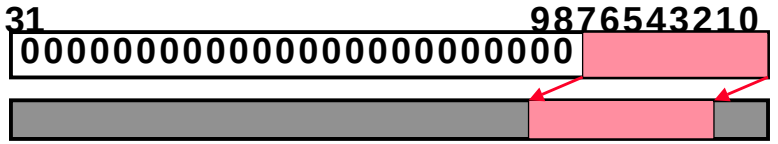


```
mov a1, a1, lsr #24 ;8 bits to right end(7-0)
```

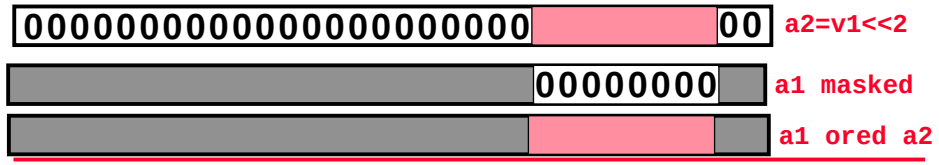


Inserting a field of bits

° Insert bit field into bit 9 (left bit no.) to bit 2 (size=8 bits) of register a1 from rightmost part of register v1 (rest is 0)



° Shift left field 2 bits, Mask out field, OR in field



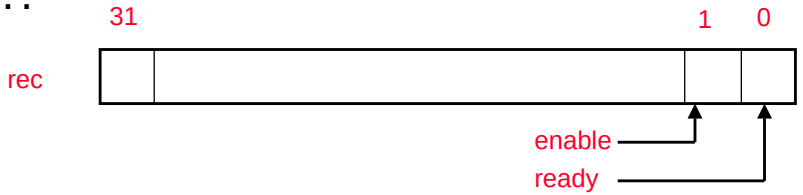
```
° mov a2, v1, lsl #2 ; field left 2
  bic a1, a1, #0x3FC ; mask out 9-2
                     ; 0x03FC = 0011 1111 1100
  orr a1, a1, a2     ; OR in field
```

; bic stands for 'bit clear, where '1' in the second operand clears
; the corresponding bit in the first

Bit manipulation in C (#1/2)

- Convert C code to ARM ASM
- Bit Fields in C (Word as 32 bits vs int/unsigned!)

```
struct {
    unsigned int ready:  1; /* bit 0 */
    unsigned int enable: 1; /* bit 1 */
} rec;
rec.enable = 1;
rec.ready = 0;
printf("%d %d", rec.enable, rec.ready);
...
```

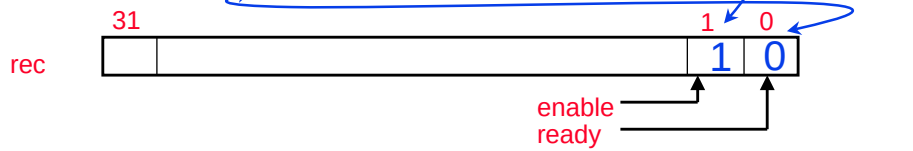


Brian Kernighan & Dennis Ritchie:
The C Programming Language, 2nd Ed., PP 150

Bit manipulation in C (#2/2)

```
struct {
    unsigned int ready:  1; /* bit 0 */
    unsigned int enable: 1; /* bit 1 */
} rec; /* v1 */
rec.enable = 1;
rec.ready = 0;
printf("%d %d", rec.enable, rec.ready);
```

```
orr v1,v1, #0x2          ;1 in bit 1
bic v1,v1  #1            ;0 in bit 0,
```



```
ldr a1, =LCO             ;printf format
mov a2, v1, lsr #1       ;just bit 1
and a2, a2,0x0001         ;mask down to 1
and a3, v1, 0x0001       ;just bit 0
bl    printf             ;call printf
```

Multiply by Power of 2 via Shift Left (#1/3)

- In decimal:
  - Multiplying by 10 is same as shifting left by 1:
    - $714_{10} \times 10_{10} = 7140_{10}$
    - $56_{10} \times 10_{10} = 560_{10}$
  - Multiplying by 100 is same as shifting left by 2:
    - $714_{10} \times 100_{10} = 71400_{10}$
    - $56_{10} \times 100_{10} = 5600_{10}$
  - Multiplying by 10^n is same as shifting left by n

Multiply by Power of 2 via Shift Left (#2/3)

- In binary:
  - Multiplying by 2 is same as shifting left by 1:
    - $11_2 \times 10_2 = 110_2$
    - $1010_2 \times 10_2 = 10100_2$
  - Multiplying by 4 is same as shifting left by 2:
    - $11_2 \times 100_2 = 1100_2$
    - $1010_2 \times 100_2 = 101000_2$
  - Multiplying by 2^n is same as shifting left by n

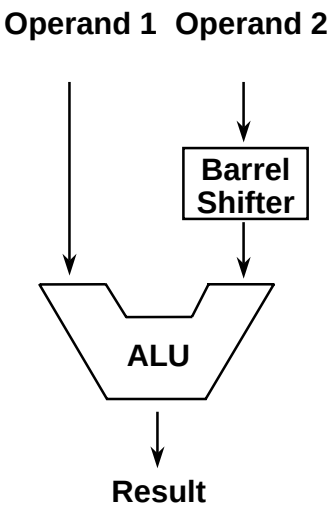
Multiply by Power of 2 via Shift Left (#3/3)

° Since shifting is so much faster than multiplication (you can imagine how complicated multiplication is), a good compiler usually notices when C code multiplies by a power of 2 and compiles it to a shift instruction:

`a *= 8;` (in C)

would compile to:

`mov a0,a0,lsl #3` (in ARM)



Shift, Add and Subtract for Multiplication

Add and Subtract Examples:

```
f = 5*g          /* f = (4+1) x g */        (in C)
add v1,v2,v2 lsl #2 ; v1 = v2 + v2 *4  (in ARM)

f = 105 *g       /* f = (15 x 7) x g */  (in C)
                  /* f = (16 –1 ) x (8 – 1) x g */
rsb v1,v2,v2 lsl #4 ; v1 = -v2 + v2 *16  (in ARM)
                      ; f = (16-1)* g
rsb v1,v1,v1 lsl #3  ; v1 = -v1 + v1 *8  (in ARM)
                      ; f = (8-1)* f
```

Shift, Add and Subtract for Division

- ARM does not have division.
- Division A/B produces a quotient and a remainder.
- It should be done via sequence of subtraction and shifting (See Experiment 3)
- For B in A/B a constant value (eg 10) simpler technique via Shift, Add and Subtract is available (Will be discussed later)

Shift Right Arithmetic; Divide by 2???

° Shifting left by n is same as Multiplying by 2^n

° Shifting right by n bits would seem to be the same as dividing by 2^n

° Problem is signed integers
- Zero fill is wrong for negative numbers

° Shift Right Arithmetic (`asr`); sign extends (replicates sign bit);

° 1111 1111 1111 1000 = -8

° 1111 1111 1111 1100 = -4

° 1111 1111 1111 1110 = -2

° 1111 1111 1111 1111 = -1

Is asr really divide by 2?

° Divide +5 by 4 via `asr 2`; result should be 1

0000 0000 0000 0000 0000 0000 0000 0101

0000 0000 0000 0000 0000 0000 0000 0001

° = +1, so does work

° Divide -5 by 4 via `asr 2`; result should be -1

1111 1111 1111 1111 1111 1111 1111 1011

1111 1111 1111 1111 1111 1111 1111 1110

° = -2, not -1; Off by 1, so doesn't always work

° Rounds to –∞

MULTIPLY (unsigned): Terms, Example

° Paper and pencil example (unsigned):

```
Multiplicand    1000
Multiplier      1001
                1000   +
               0000    +
              0000     +
             1000      +
Product     01001000
```

•m bits x n bits = m+n bit product

•32-bit value x 32-bit value = 64-bit value

MULTIPLY (signed)? #(1/3)

° Paper and pencil example

```
Multiplicand    1000        -8 x
Multiplier      1001        -7
                1000   +
               0000    +
              0000     +
             1000      +
Product     01001000   72 ≠ 56
```

° Solution 1:

° 2's complement range for 4 bit number is –8≤ a ≤7 ➔ – 56 ≤ a x b ≤ 64.

° Can build a big lookup table (16 x 16 = 256) to map from binary bit patterns to multiplication results.

```
-8 x –8 = 01000000 ← → 64
-8 x –7 = 01001000 ← → 56
                |
-2 x –2 = 11000100 ← → 04
-1 x -1 = 11100001 ← → 01
                |
+7 x +7 = 00110001 ← → 49
```

MULTIPLY (signed)? #(2/3)

° Solution 2:

```
Multiplicand  1001        -7 x
Multiplier    1000        -8
           00000000  +
           0000000   +
           000000    +
           11001     –
Product    00111000    56 = 56
```

```
Multiplicand  1001        -7 x
Multiplier    1000        -8
           00000000  +
           0000000   +
           000000    +
           00111     +
Product    00111000   56 = 56
```

MULTIPLY (signed)? #(3/3)

° Solution 2 (Another example):

```
Multiplicand   1001        -7 x
Multiplier     1001        -7
            11111001   +
            0000000    +
            000000     +
            11001      —
Product     00111000     49 = 49
```

```
Multiplicand   1001        -7 x
Multiplier     1000        -7
            11111001+
            0000000 +
            000000  +
            00111   +
Product     00110001     49 = 49
```

Multiplication Instructions

° The Basic ARM provides two multiplication instructions.

° Multiply
- `mul Rd, Rm, Rs ; Rd = Rm * Rs`

° Multiply Accumulate - does addition for free
- `mla Rd, Rm, Rs,Rn ; Rd = (Rm * Rs) + Rn`

$$\sum_{i=0}^{N} a_i \times b_i$$

° (Lower precision multiply instructions simply throws top 32bits away)

° Restrictions on use:
- Rd and Rm cannot be the same register
  - Can be avoided by swapping Rm and Rs around. This works because multiplication is commutative.
- Cannot use PC.

These will be picked up by the assembler if overlooked.

° Operands can be considered signed or unsigned
- Up to user to interpret correctly.

Multiplication Example

° Example:
- in C: `a = b * c;`
- in ARM:
  - let b be v1; let c be v2; and let a be v3 (It may be up to 64 bits)

```
mul v3, v2, v1 ;a = b*c
               ; lower half of product into
               ; v3. Upper half is thrown up
```

° Note: Often, we only care about the lower half of the product.

Multiplication and Accumulate Example

° One example of use of `mla` is for string to number conversion: eg

```
Convert string="123" to value=123
   value = 0
   loop = 0
   len = length of string
   Rd = value
   while loop <> len
   c = extract(string, len - loop,1)
   Rm = 10 ^ loop
   Rs =  ASC(c) - ASC ('0')
   mla Rd, Rm, Rs, Rd
   loop = loop + 1
   endwhile
```

Multiply-Long and Multiply-Accumulate Long

- Instructions are
  - MULL which gives RdHi,RdLo:=Rm*Rs
  - MLAL which gives RdHi,RdLo:=(Rm*Rs)+RdHi,RdLo
- However the full 64 bit of the result now matter (lower precision multiply instructions simply throws top 32 bits away)
  - Need to specify whether operands are signed or unsigned
- Therefore syntax of new instructions are:
  - `umull RdLo,RdHi,Rm,Rs ;RdHi,RdLo:=Rm*Rs`
  - `umlal RdLo,RdHi,Rm,Rs ;RdHi,RdLo:=(Rm*Rs)+RdHi,RdLo`
  - `smull RdLo, RdHi, Rm, Rs ;RdHi,RdLo:=Rm*Rs (Signed)`
  - `smlal RdLo, RdHi, Rm, Rs ;RdHi,RdLo:=(Rm*Rs)+RdHi,RdLo (Signed)`

$$\sum_{i=0}^{N} a_i \times b_i$$

- Not generated by some compilers. (Needs Hand coding)

Division

- No Division Instruction in ARM
- Division has two be done in software through a sequence of shift/ subtract / add instruction.
  - General A/B implementation (See Experiment 3)
  - For B in A/B a constant value (eg 10) simpler technique via Shift, Add and Subtract is available (Will be discussed later)

Quiz

1. Specify instructions which will implement the following:

   a) a1 = 16 b) a2 = a1 * 4

   c) a1 = a2 / 16 (r1 signed 2's comp.) d) a2 = a3 * 7

2. What will the following instructions do?

   a) `add a1, a2, a2, lsl #2` b) `rsb a3, a2, #0`

3. What does the following instruction sequence do?

```
add a1, a2, a2, lsl #1
sub a1, a1, a2, lsl #4
add a1, a1, a2, lsl #7
```

Quiz Solution (#1/2)

1. Specify instructions which will implement the following:

   a) a1 = 16 `mov a1, #16`

   b) a2 = a1 * 4 `mov a2, a1, lsl #2`

   c) a1 = a2 / 16 (r1 signed 2's comp.) `mov a1, a2, asr #4`

   d) a2 = a3 * 7 rsb `a2, a3, a3, lsl #3`

   a2 = a3* (8-1)

whereas `sub a2, a3, a3, lsl #3` would give a3* -7

2. What will the following instructions do?

   a) `add a1, a2, a2, lsl #2`

   a1= a2 + (a2 * 4) ie a1:=a2*5

   b) `rsb a3, a2, #0`

- r2=0-r1 ie r2:= -r1

Quiz Solution (#2/2)

3. What does the following instruction sequence do?

```
add a1, a2, a2, lsl #1
sub a1, a1, a2, lsl #4
add a1, a1, a2, lsl #7
```

```
a1 = a2 + (a2 * 2) = a2 * 3
a1 = a1 - (a2 * 16)= (a2 * 3) - (a2 * 16) = a2 * -13
a1 = a1 + (a2 * 128) =  (a2 * -13) + (a2 * 128)
                     = r1 * 115
                     i.e.  a1 = a2 * 115
```

ELEC2041 Reading Materials (Week #4)

- Week #4: Steve Furber: ARM System On-Chip; 2nd Ed, Addison-Wesley, 2000, ISBN: 0-201-67519-6. We use chapters 3 and 5
- ARM Architecture Reference Manual –On CD ROM

"And in Conclusion…"

- New Instructions:

```
mul
mla
umull
umlal
smull
smlal
```
